

Testing Plan

- Our testing plan for the current state of our project is focused on the functionality of our login in system. Currently we have a working frontend UI built with angular. Since angular runs entirely in the browser and creates a simulated backend, there was no need for us to create backend database functionality with other tools.
- Our tests consist of creating a user and logging in. Once logged in, we test the basic functionality of our UI.
- With the database configured, our testing plan consists of consistent access to the database.
- Access to database from frontend UI
- Ability to upload repos from UI to database
