Testing Plan

- Our testing plan for the current state of our project is focused on the functionality of our login in system. Currently we have a working frontend UI built with angular. Since angular runs entirely in the browser and creates a simulated backend, there was no need for us to create backend database functionality with other tools.
- Our tests consist of creating a user and logging in. Once logged in, we test the basic functionality of our UI.
- As of now we only have place holders set up for our augur repository submission, so moving forward into sprint 4 we are going to be conducting tests getting the augur backend set up to our UI. Once we are certain the augur database is configured, we are going to update our UI, and make sure submitted repo's show up in the augur database.
- After that our project should be complete.
